

DIABETES AND INTERVENTIONAL RADIOLOGY

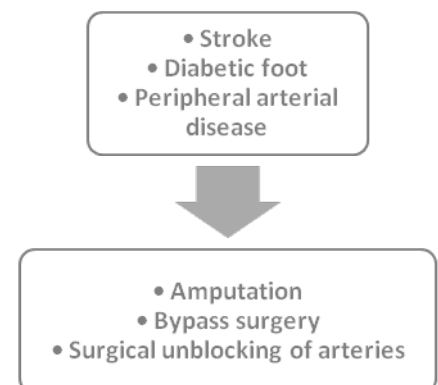

Question: How can the complications of diabetes, one of the top-five causes of death worldwide, be treated effectively, without a scalpel in sight?

Answer: With interventional radiology (IR)!
Using medical imaging (e.g. MRI) IR provides precise and effective treatments, with minimal discomfort to the patient.

Interventional radiology treats the complications of diabetes directly and without the need for surgery. Microcatheters are guided through the arteries to enable rapid treatments that are gentle yet effective.

The most common complications of diabetes and their traditional treatment methods:

Interventional radiology is ready to revolutionise diabetes management with these procedures.

Wider application of interventional radiology could spare patients much suffering and save money for hospitals.
